COUPLED-BUNCH INSTABILITY AT LHC TOP ENERGY FOR THE TCTV (TRAPPED MODES) ALONE

E. Métral

- **AG computed the impedance of transverse modes in the TCTV (W jaw) for a (full) gap of 3 mm**
- **There are few of them**
- **The 2 most critical trapped modes are**

$$f_{r1} = 0.362\ \text{GHz} \qquad Q_1 = 1700 \qquad R_{y1} = 152.8\ \text{M}\Omega/\text{m}$$

$$f_{r2} = 0.443\ \text{GHz} \qquad Q_2 = 1080 \qquad R_{y2} = 173.8\ \text{M}\Omega/\text{m}$$

Latest collimator list (except TDI and TCDQ treated separately) sent by G. Robert-Demolaize on 11/10/05

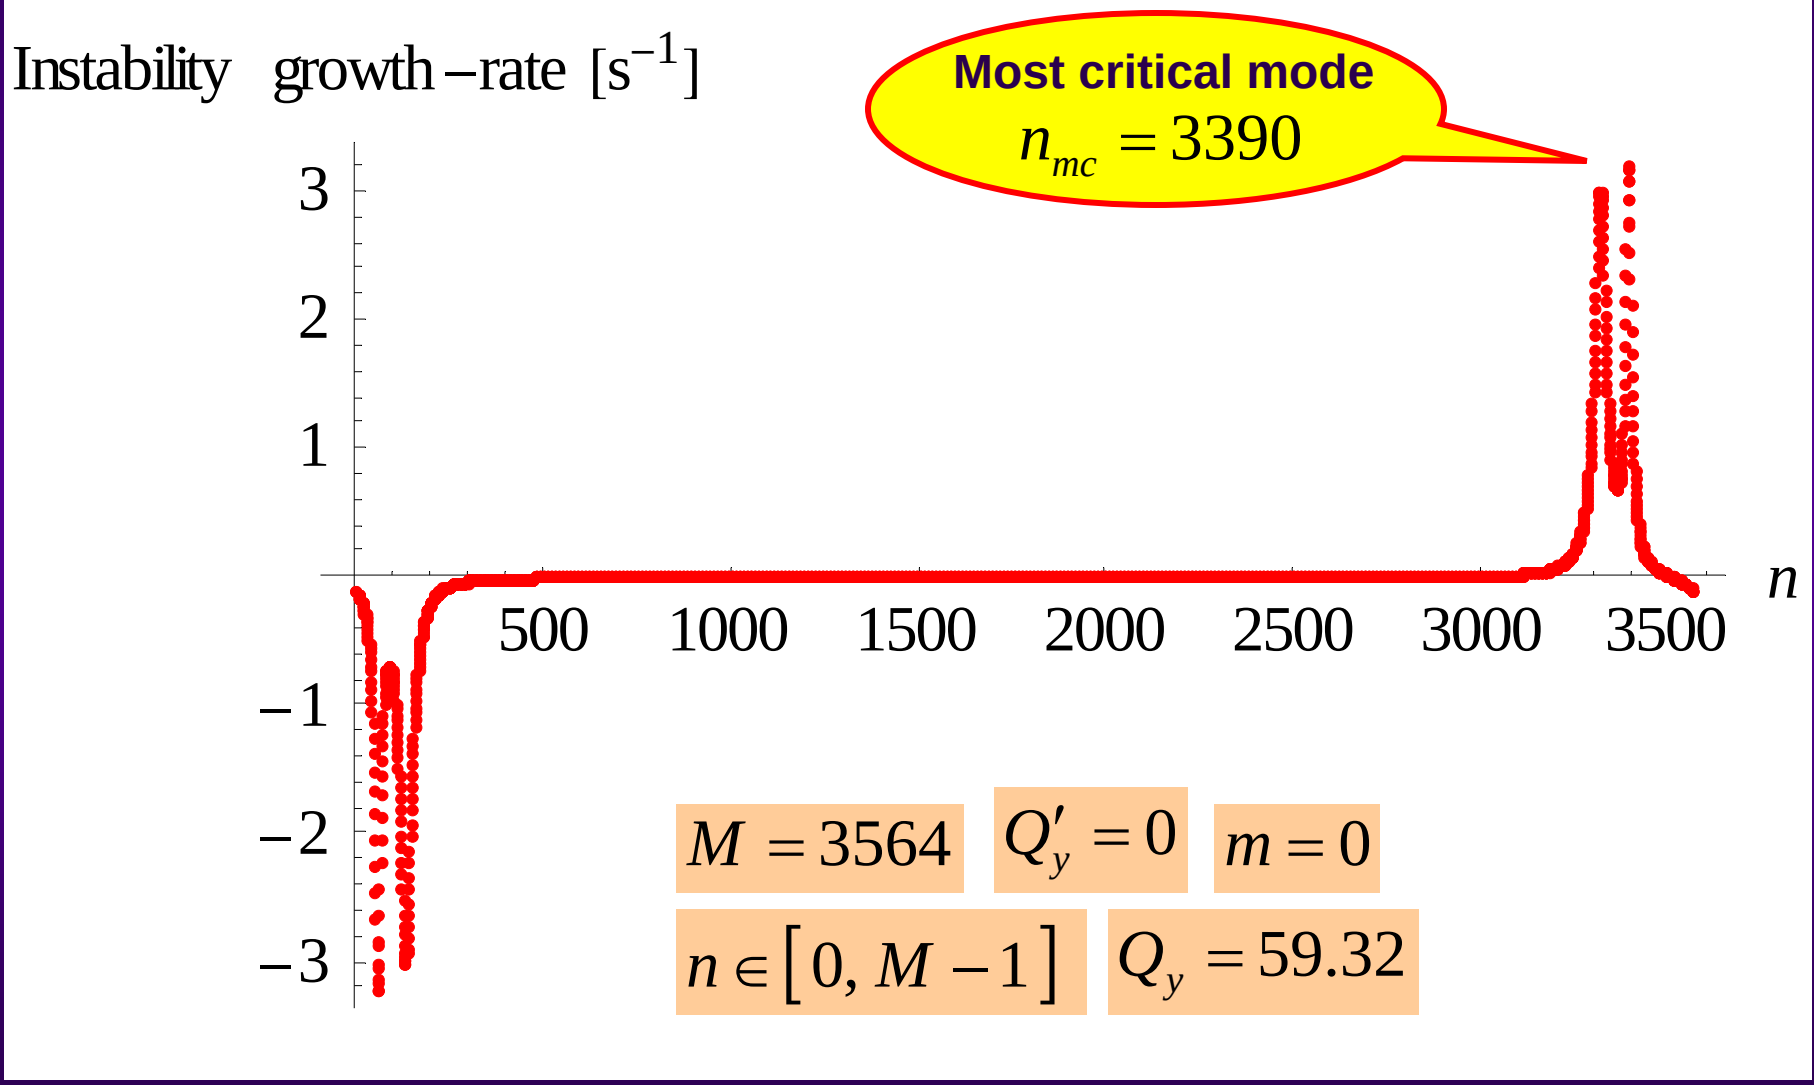
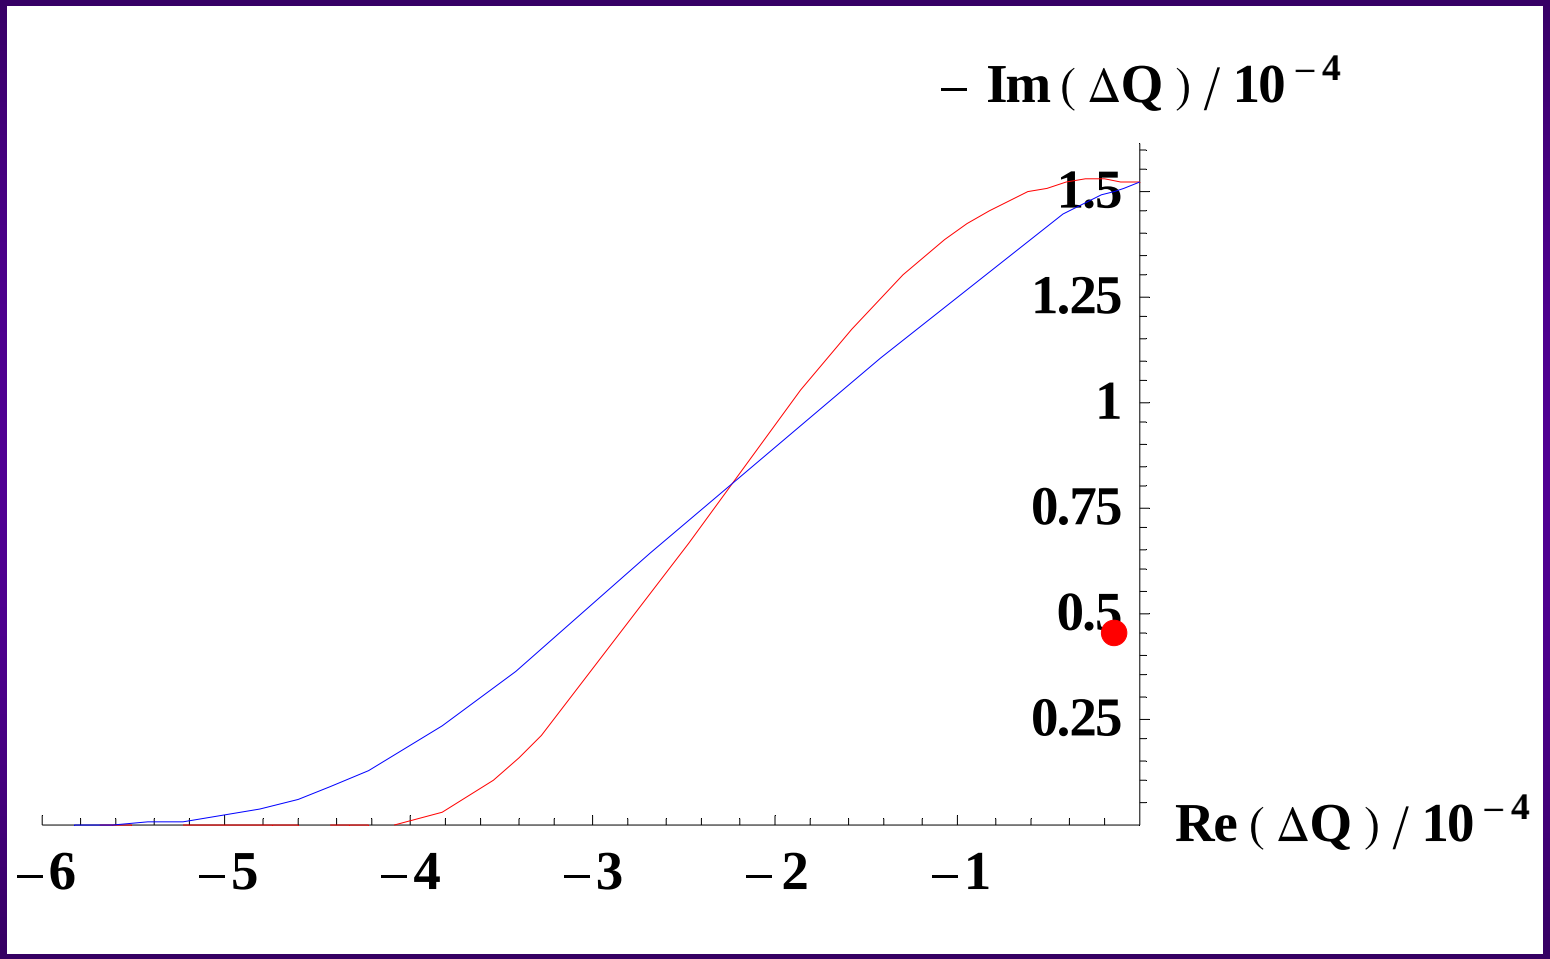
Coupled-bunch instability growth-rates vs. coupled-bunch mode *n*

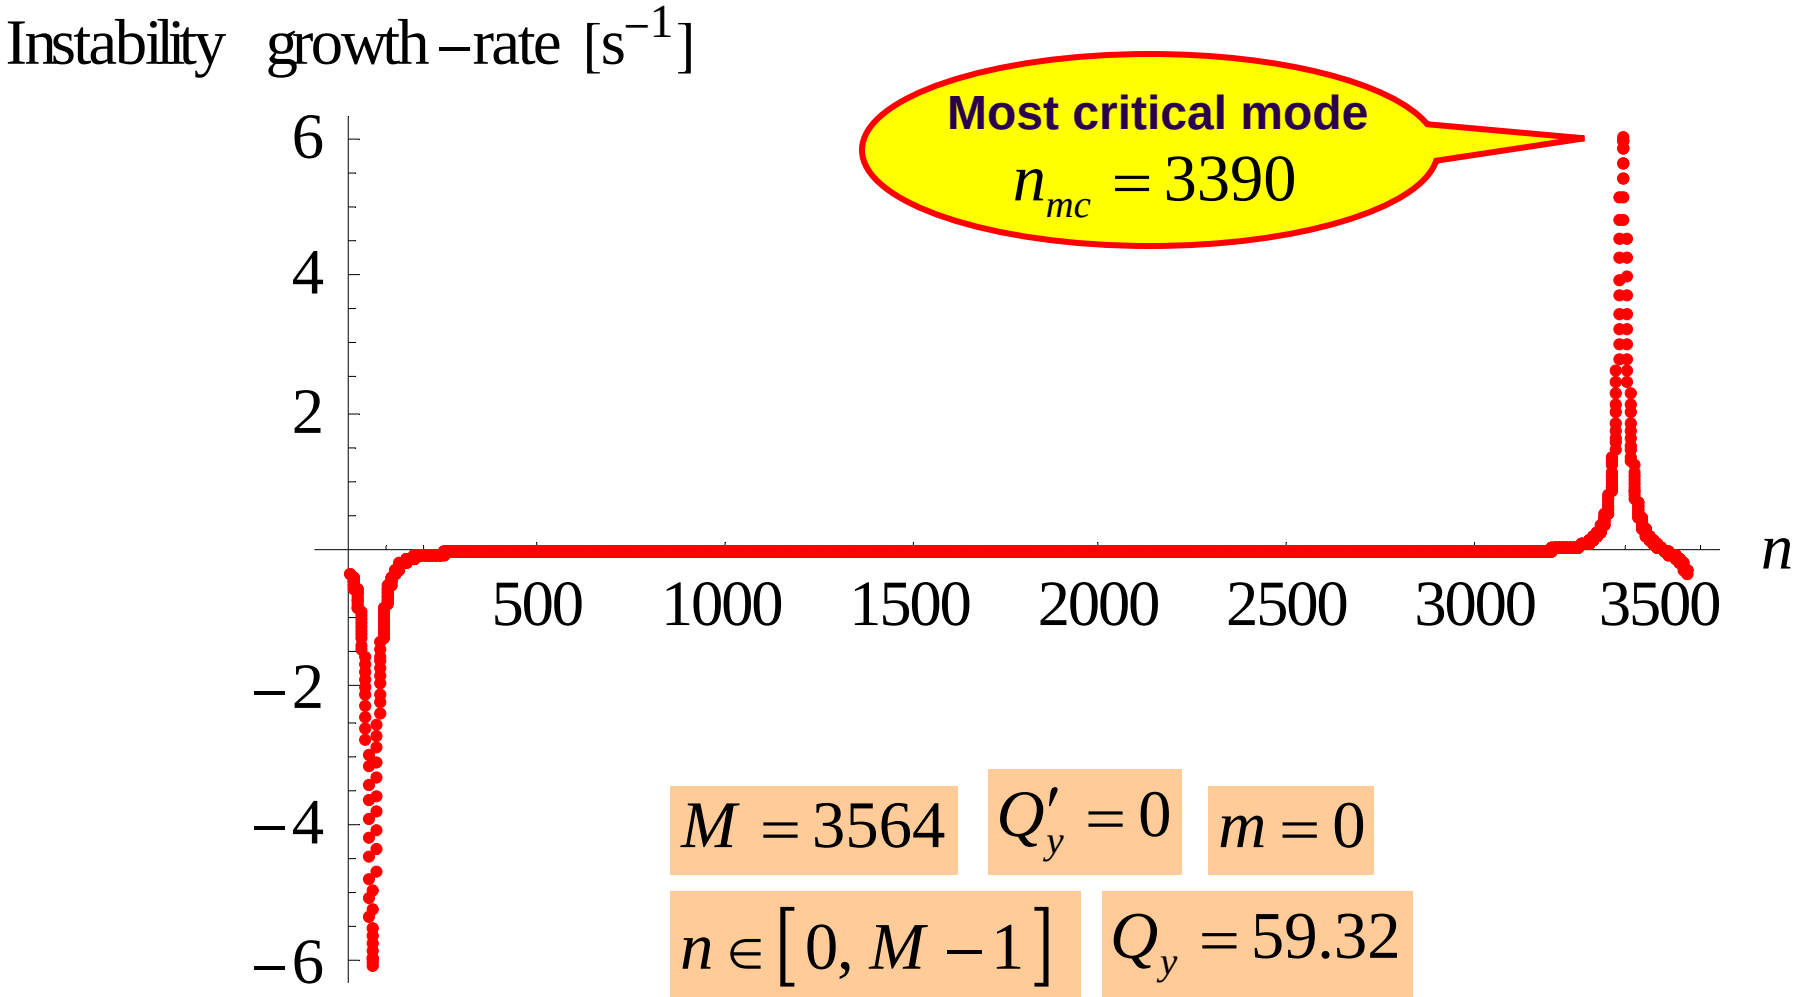


Tune shift and stability diagram



Coupled-bunch instability growth-rates vs. coupled-bunch mode *n*

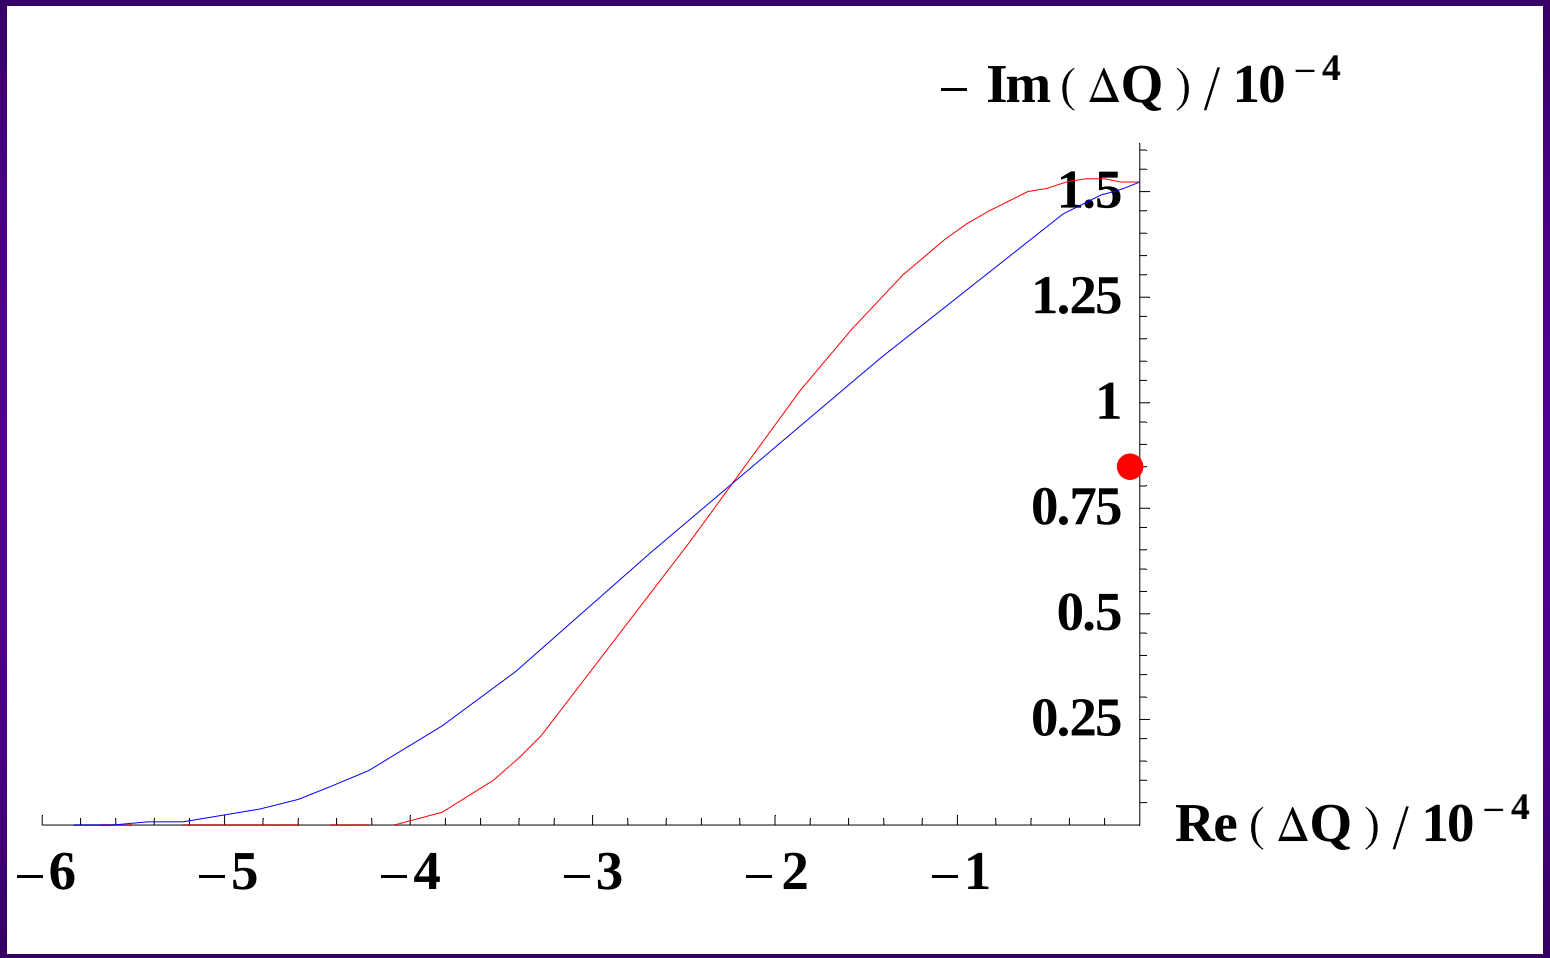
If the frequency of the 2nd resonator is exactly on a betatron line (0.442 GHz instead of 0.443 GHz)



$M = 3564$ $Q'_y = 0$ $m = 0$

$n \in [0, M-1]$ $Q_y = 59.32$

Tune shift and stability diagram



CONCLUSION

- **If the resonance frequency of the 2nd resonator is exactly on a betatron line, i.e. if it is in fact 0.442 GHz instead of 0.443 GHz, then the imaginary part is at less than a factor 2 below the limit**

  ⇒ If one can still do something we should try to decrease the impedance of these trapped modes
