Hello,

Here is information that may interest some of you.

Tobias has integrated a TIMBER interface into YASP, providing tools to load data directly from TIMBER into YASP using various selection criteria.

The interface is available in the **Logging** tab of the data collection panel (maneu Machine Special, Multiple Acquisitions).

It is possible to extract orbit data:

- over a given time range,
- for a select fill according to the mode,
- for a range of fills at a given time wrt a mode change.

The number of orbits is presently limited to 200.

Cheers, Jorg
